TASKFLOW

Project purpose

Taskflow is a simple backend project for managing tasks in a software team. I made it with Node.js and Express.js to practice building a REST API and basic CRUD operations.

How it works

The API keeps a list of tasks. A task has a title, description, priority, assignee and status. Tasks can be created, listed, viewed by ID, updated and deleted.

Routes

- GET /tasks - lists all tasks
- GET /tasks/:id - shows one task
- POST /tasks - creates a task
- PUT /tasks/:id - updates a task
- DELETE /tasks/:id - deletes a task

Logger middleware

I also added a simple logger middleware. For every request, it prints the request method, URL and date in the console.

Testing

I tested the CRUD routes with Postman. I saved screenshots for create, list, detail, update and delete requests and included them in the project folder “screenshots”.

Tools used

- Node.js
- Express.js
- JavaScript
- Postman
